

# Solubility

Sections 8.2-8.3

# Solubility

- **Solubility:** the amount of solute that can dissolve in a given amount of solvent
- Usually in **g/100 mL**
- **Unsaturated:** if solution contains less than maximum amount of solute in solvent
- **Saturated:** if solution contains maximum amount of solute in solvent

# “Mixability”

- General rules for whether a solute will dissolve in a solvent
- IMF of solute and solvent must be similar in strength
  - Encourages strong interactions between solute particles and solvent particles
- Think “like dissolves like”

# Like Dissolves Like

- Most ionic compounds and polar covalent compounds are soluble in water, a polar solvent
- Nonpolar compounds are soluble in nonpolar solvents
- This is why oil and water don't mix
  - Oil is a nonpolar compound
  - Water is a polar solvent

# Like Dissolves Like

Stearic acid–Water insoluble

many nonpolar C–C and C–H bonds

Most of the molecule is nonpolar, so it is not attracted to a polar solvent like  $\text{H}_2\text{O}$ .

polar C–O and O–H bonds

Glucose–Water soluble

many O–H bonds for hydrogen bonding to  $\text{H}_2\text{O}$

# Example #1

Which compounds are water soluble?

a.  $\text{NaNO}_3$

b.  $\text{CH}_4$

c.  $\text{KBr}$

# Example #1 Solved

- a.  $\text{NaNO}_3$ : ionic compound – **soluble in water**
- b.  $\text{CH}_4$ : nonpolar covalent compound – **insoluble in water**
- c.  $\text{KBr}$ : ionic compound – **soluble in water**

# Ionic Solubility

- In general, ionic compounds are soluble in water
- Then again, some are not
- There is a set of general rules for solubility
  - You needed this for your “ionic solutions lab”

# General Rules for Solubility

<u>Ion</u>	<u>Solubility</u>	<u>Exceptions</u>
$\text{NO}_3^-$	soluble	none
$\text{ClO}_4^-$	soluble	none
$\text{Cl}^-$	soluble	except $\text{Ag}^+$ , $\text{Hg}_2^{2+}$ , $\text{Pb}^{2+}$
$\text{I}^-$	soluble	except $\text{Ag}^+$ , $\text{Hg}_2^{2+}$ , $\text{Pb}^{2+}$
$\text{SO}_4^{2-}$	soluble	except $\text{Ca}^{2+}$ , $\text{Ba}^{2+}$ , $\text{Sr}^{2+}$ , $\text{Hg}^{2+}$ , $\text{Pb}^{2+}$ , $\text{Ag}^+$
$\text{CO}_3^{2-}$	insoluble	except Group IA and $\text{NH}_4^+$
$\text{PO}_4^{3-}$	insoluble	except Group IA and $\text{NH}_4^+$
$\text{-OH}$	insoluble	except Group IA, $\text{Ca}^{2+}$ , $\text{Ba}^{2+}$ , $\text{Sr}^{2+}$
$\text{S}^{2-}$	insoluble	except Group IA, IIA and $\text{NH}_4^+$
$\text{Na}^+$	soluble	none
$\text{NH}_4^+$	soluble	none
$\text{K}^+$	soluble	none

\*slightly soluble

# How to Use Table

- Only need to match one ion, either cation or anion
- “insoluble” means not soluble
- Example:  $\text{CaSO}_4$
- $\text{Ca}^{2+}$  is not listed under ion list, but  $\text{SO}_4^{2-}$  is
- Generally  $\text{SO}_4^{2-}$  is soluble, but  $\text{Ca}^{2+}$  is an exception so  $\text{CaSO}_4$  is **insoluble**

# Example #2

Use the solubility rules to predict whether the following ionic compounds are soluble in water:

# Example #2 Solved

- a.  $\text{Li}_2\text{CO}_3$ :  $\text{Li}^+$  is not listed but  $\text{CO}_3^{2-}$  is
  - Generally  $\text{CO}_3^{2-}$  is insoluble, but  $\text{Li}^+$  is an exception so  $\text{Li}_2\text{CO}_3$  is **soluble**
  
- b.  $\text{KBr}$ :  $\text{K}^+$  is listed
  - Generally  $\text{K}^+$  is soluble with no exceptions so  $\text{KBr}$  is **soluble**
  
- c.  $\text{Ca}_3(\text{PO}_4)_2$ :  $\text{Ca}^{2+}$  is not listed but  $\text{PO}_4^{3-}$  is
  - Generally  $\text{PO}_4^{3-}$  is insoluble,  $\text{Ca}^{2+}$  is not an exception so  $\text{Ca}_3(\text{PO}_4)_2$  is **insoluble**

# Effects on Solubility

- Two factors can affect solubility
- Temperature
- Pressure

# Temperature Effects

- For most ionic and molecular solids, solubility increases with temperature
  - Think about adding sugar to tea, vs. iced tea
- For gases, the opposite is true, gas solubility decreases with temperature
  - This is because when temperature is increased the gas particles are moving faster and are less likely to interact and mix with solvent particle
  - Similar to the idea of vapor pressure

# Pressure Effects

- Changes in pressure affect a gas's solubility in a liquid
- **Henry's Law:** the solubility of a gas is directly proportional to the partial pressure of the gas above the liquid
- The higher the pressure, the higher the solubility
  - Think about a pressurized can of soda, once the can is opened, the pressure decreases, so the  $\text{CO}_2$  gas dissolved in the soda comes out

# Example #3

Predict the effect each change has on the solubility of  $\text{Na}_2\text{CO}_3(s)$ :

- a. Increasing the temperature
- b. Decreasing the temperature
- c. Increasing the pressure
- d. Decreasing the pressure

# Example #3 Solved

- a. Increasing the temperature: **increase solubility**
- b. Decreasing the temperature: **decrease solubility**
- c. Increasing the pressure: **no effect**
- d. Decreasing the pressure: **no effect**

# Example #4

Which pairs of compounds will form a solution?

- a. Benzene ( $\text{C}_6\text{H}_6$ ) and hexane ( $\text{C}_6\text{H}_{14}$ )
- b.  $\text{Na}_2\text{SO}_4$  and  $\text{H}_2\text{O}$
- c.  $\text{NaCl}$  and hexane
- d.  $\text{H}_2\text{O}$  and  $\text{CCl}_4$

# Example #5

Use the solubility rules to predict whether the following ionic compounds are soluble in water:

# Example #6

Predict the effect each change has on the solubility of  $\text{N}_2(\text{g})$ :

- a. Increasing the temperature
- b. Decreasing the temperature
- c. Increasing the pressure
- d. Decreasing the pressure
